

Remdesivir, dexamethasone and STOP-COVID19

- Patients who are already receiving remdesivir and/or dexamethasone can still be recruited into STOP-COVID19 and receive the trial treatment.
- Similarly, participants already enrolled in STOP-COVID19 can receive remdesivir and/or dexamethasone and continue their STOP-COVID19 treatment.
- Information will be collected in STOP-COVID19 on use of remdesivir and dexamethasone at baseline and during the duration of the trial.
- The STOP-COVID19 protocol does not exclude participants from receiving standard care treatments.
- If you have any further questions, please contact the trial team:
